

Engineering and design improvements have allowed removal and replacement of some components. These may include some or all of the following:

1. The direction switch is no longer needed. This is the one with the yellow, blue, and white wires. It was replaced with an on board solid state switch.
2. A relay was replaced by a solid state switch: you may see only one not two.
3. Four wire (gray, green, orange, purple) center tapped pots have been replaced with three wire pots: the grey wire is not needed.
4. Some terminal strips markings are in a different order. Please wire letter for letter, not by positional order.
5. Some trim pots have been relocated but have same function as before.

These new boards still meet the “form-fit-function” of the original and carry a full one year warranty.

Call Jim Hindley for any further questions.
